Hitches and pivoting front linkage now available for smaller John Deere models

While LH Lift previously offered the pivoting front linkage for the bigger John Deere models, it is now available also for the 4R series. The pivoting front linkage turns up to 35° in both directions and can lift up to 750 kilos. John Deere 4R tractors fitted with the pivoting front linkage are well suited for property maintenance tasks, as well as golf course and cemetery maintenance.

Another new product offered by LH Lift is a rear hitch for John Deere 3R, 4R and 5000 series tractors. The rear hitch raises hydraulically and lowers mechanically, making it much easier to attach trailers and implements to tractors.

“The rear hitch is easy to fit by yourself or by your local mechanic. It is available through John Deere importers in Finland and the other Nordic markets,” Leppäkangas says.
