Pivoting front linkage now available also for John Deere, Case and New Holland tractors

LH Lift's pivoting front linkage is now available also for John Deere 4R series tractors, Case Farmall U Pro series tractors and New Holland T6 series tractors.

"Fitted with our pivoting front linkage, the Case Farmall U Pro is well suited for property maintenance tasks, for example, while the larger New Holland models are more suitable for tasks such as forage harvesting," says Project Manager Risto Leppäkangas.

LH Lift has its sights also on export markets with its new products. Tractors in the 99 to 114 horsepower range and fitted with the pivoting front linkage are ideal for mowing tasks in the Alps, for example.

"In Austria, tractors in this size range fitted with a front PTO and linkage are extremely popular for mowing small fields in the mountains, so we are looking into export opportunities," Leppäkangas adds.

The innovative pivoting front linkage was first introduced on the Valtra N Series. In 2007 the pivoting front linkage was awarded the DLG Silver Medal, one of the most prestigious awards in the agricultural machinery sector, at the Agritechnica trade fair in Hanover, Germany. The pivoting front linkage is now available on Valtra, Case, New Holland and John Deere tractors, as well as on Fendt tractors.
